

PREVENTATIVE MEASURES TO HELP AVOID FROZEN WATER LINES DURING EXTREMELY COLD WEATHER

1. Let a small stream of water, both hot and cold run through your faucets, especially if they are located on a north wall that is not insulated.
2. Open cabinet doors under kitchen and bathroom sinks to allow warm air to circulate.
3. Water lines located in non-heated areas, such as a garage can be protected by using either a heat tape on the water lines or hanging a heat lamp in close proximity to thaw.
